

Funding the Future

Do you want it warm today and fried tomorrow? The nucle..

Published: January 13, 2026, 11:04 am

From this morning's letters page in the Guardian:

There are far cheaper, safer, quicker, more efficient ways of addressing the climate challenge than pursuing nuclear power. Accelerating the deployment of energy-efficiency measures, demand-response, demand-reduction and distributed-generation policies, and renewable technologies, would help drive wholesale electricity costs down and deliver more value for money as a pathway to decarbonising electricity generation.

The Green New Deal Group, of which I am part, outlined just such an approach in a [report last week](#). Investment in renewables, alongside a nationwide project to make every building in the country energy-efficient, would create hundreds of thousands of high-quality jobs across the country, as well as reducing both fuel bills and emissions.
