The [FT has reported](#) that:

Extreme weather drove the growth in energy demand last year to its highest level since 2010, triggering warnings of a “vicious cycle” fuelled by reliance on heating and cooling systems that could worsen the world’s carbon emissions crisis.

Energy group BP said in its closely watched annual market review that energy consumption grew 2.9 per cent in 2018, led by China and the US, despite modest economic growth and strengthening oil and gas prices.

Have the feedback loops that could make the climate crisis so much worse already begun to have an impact?
