---

I asked when posting a poll this morning whether a bullet-point summary of [my argument for eliminating bond markets](#), generated by AI, would be beneficial.

This is what ChatGPT made of that article. I asked it to summarise it using numbered headings with bullet-pointed sub-headings. I have not edited the output. Your opinion would be of use.

---

## **1. We are not short of funds - we are awash with them**

\*

As Martin Wolf has frequently highlighted in the ***Financial Times***, the world suffers from a chronic savings glut.

\*

Vast pools of capital are searching for safe and meaningful returns.

\*

The problem is not excessive government borrowing, but the failure of financial markets to match surplus savings with socially useful investment.

\*

This is a structural failure of capitalism, not a fiscal crisis.

---

## **2. Quantitative tightening is a political choice - and the wrong one**

\*

The reversal of QE through QT is not an economic necessity but a decision driven by inflation fears and deficit dogma.

\*

QT drains liquidity from the financial system at a time when capital is not flowing to

where it is needed.

\*

QT worsens market dysfunction and increases the appearance of funding stress for governments.

\*

Ending QT would relieve pressure on bond markets and reduce borrowing costs.

---

### ***3. QE worked - and could work again***

\*

QE lowered borrowing costs, stabilised financial markets, and supported public investment.

\*

It showed that central banks can play an active role in supporting government finance.

\*

There is no technical reason QE cannot be reactivated, albeit perhaps redesigned.

\*

Reintroducing QE would be rational in a world where private markets are failing to deliver capital for public need.

---

### ***4. Governments are not like households - they have more tools***

\*

Governments issue currency and are not revenue-constrained in the same way private actors are.

\*

The UK government can, legally, borrow directly from the Bank of England via the Ways and Means Account.

\*

This option avoids reliance on private bond markets when those markets are dysfunctional.

\*

There is no constitutional, legal, or economic requirement for the government to behave as if it is financially constrained.

---

## **5. Wealth taxes are the obvious and fair alternative**

\*

The wealthy have gained the most from low interest rates, asset price inflation, and generous tax cuts.

\*

They are not paying proportionate tax relative to their gains.

\*

If inflation control is needed alongside investment, taxing wealth is the best solution.

\*

This also addresses inequality and improves social cohesion.

---

## **6. Cutting public spending is not a real option**

\*

Philip Coggan suggests governments must either cut spending or find new bond buyers.

\*

Cutting spending would deepen poverty, reduce economic activity, and destroy essential services.

\*

It would hurt the vulnerable and make inequality worse.

\*

No serious economist believes this is a viable route to long-term economic health.

---

## **7. The problem is structural - not excessive public spending**

\*

Gilt markets and modern finance are based on 19th-century assumptions about money, savings, inflation, and state risk.

\*

These markets serve speculators, not society.

\*

The system is no longer designed to deliver long-term capital for public good.

\*

Blaming governments for the failures of these systems is a fundamental misdiagnosis.

---

### **8. It's time for purpose-driven public finance**

\*

Governments should move beyond selling generic gilts into volatile markets.

\*

They should create savings products that meet social goals and attract domestic savers:

\*

**Green New Deal bonds** for climate infrastructure

\*

**NHS bonds** to invest in care and staffing

\*

**Local resilience bonds** to support communities

\*

These instruments could appeal to savers holding excess capital who seek safe, socially purposeful investment.

\*

This echoes the post-war savings drives that rebuilt Britain – and could do so again.

---

### **9. The real crisis is political cowardice, not public debt**

\*

The idea that we have run out of fiscal road is false.

\*

The road has been narrowed by ideology – not economics.

\*

We lack courage, not cash.

\*

We must stop appeasing markets and start designing financial structures that serve people and planet.

\*

It is time to reimagine government finance for the 21st century.
